

WORKOUT of the Month

A new concept in weight training instruction. A workout by workout, set by set, rep by rep workout plan, with exact training poundages specified over the entire span of a strength training cycle, laid out for you by a top Powerlifting authority. Each month, a different lift is analyzed. For those of different strength levels than the starting poundage specified, simply increase or decrease the training weights in direct proportion. For example, if your lift is 400, and a starting lift for the program is 500, multiply the training poundages by .8 (400 divided by 500); if your lift is 500, multiply the poundages specified by 1.2 (600 divided by 500).

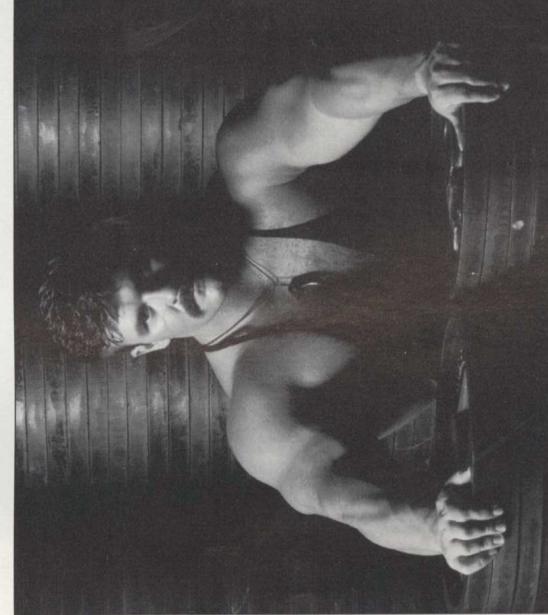

Focused Bench Pressing as told to PL USA by J.M. Blakley

Let's clear up one point right away. Bench Pressing is an attitude! The first step to a big bench is your mental perspective.

What is heavy? What isn't heavy?

These are the wrong questions. Nothing is heavy! But rather you are or are not strong enough. Quit thinking about the weight or the hardware; you must think concentrate on your strength. No bench program will work for anyone who is locked into thinking about the hardware or the load. You must think about and learn to trust your own power. My first point is this: I believe your attitude affects your success more profoundly than your training.

I use a training program that helps generate a positive attitude and forces one to build confidence in one's own power. But without risk. To build faith in oneself, one must continually put oneself on the line! This leads to growth physically and psychologically with each success and offers excellent (albeit harsh) lessons with each mistake. I take a lot of pride in my body and mind in training what you expect from them in competition. The risk is, of course, over-training. That is minimized by the simplicity of the program. However, I use as a rule joint soreness. Muscular soreness is trained through but pain around the joints is a marker for backing off. As an athlete matures, he or she learns to become very turned into his or her body and aware athletes know how far they can go. Pay attention to your body. With that in mind, my second point is to always ask the best from yourself and prove it by putting yourself on the line... frequently. As you succeed you will gain confidence and when you fail you will become aware of weak points you need to work on that you might normally learn at a meet.

press in exact competition form. The majority of your time and energy should be placed here. Master the skill of benching. Nothing is more specific to benching than the movement itself. Incline benching is a fine exercise and will strengthen the pressing group of muscles, but it is not 100 per cent transferable to flat bench. Within the flat bench there is no loss because there is no transfer, as you are practicing the exact skill and that is 100 per cent applicable. Simply stated, to get better at benching, **your must bench!**

A second exercise should accentuate the elbow joint but not completely isolate it. The goal is to learn to use the muscles together in concert to achieve a additive or even synergistic effect. Train them both but not to the sides. Use poundages that require only **45*** & **25***. Don't waste time and energy tailoring up odd bar loads and hunting for small denominated plates. You have enough to say that the bar should bounce or switch to triples with just a bit longer pause (1.5 seconds). My rule of thumb is simply that the bar should come down slower than it comes up. Down slow, up fast. That is it! **4x6** pause out from the meet (for as many weeks as 6 or 8) and **4x3** at **6 weeks** in. Of course get a whole year of great workouts and have nothing to show for it but frustration and other fond memories of how fatigued and sore they were. Don't let yourself believe for a minute that anyone cares how hard you worked or how great your workouts were. And neither should you. You should judge your workouts and program by the only ruler that matters... progress. If you are not improving, then there is no excuse you can give me for your program. Only one thing matters: getting stronger and stronger each and every workout. I want to emphasize that you must expect progress each workout. If you show no progress from one workout to the next, then why should you expect any improvement after a two-month string of such workouts? Or four months? Or six months? Keep accurate records and make no exceptions. Demand progress from yourself.

THE PROGRAM: This program is based on the above tenants. Following **simplicity**, there are just two exercises. One pressing movement that stresses the pectorals and anterior deltoids, and one tricep movement that concentrates on lockout strength. There should be no more than two exercises per body part. Following **intensity**, you must learn to pack all of your effort into those two movements. If you can do three exercises in one workout, you have not yet learned to completely extend yourself.

Following **specificity**, (which is the law that states that the body adapts to the exact demands placed upon it) the main pressing movement is the bench press. Progress is the only indicator of a program's value. Progress is the only point. No amount of soreness or fatigue or grunting or burning or sets or reps means anything. One can pile up work done, but that's all it is about. It's about what's demanded at the meet, so train accordingly.

My fifth point is to **remember** what it's all about. It's about progress. There is no substitute for progress. Progress is the only indicator of a program's value. Progress is forcing yourself to bring up all your concentration, all your effort, all your strength, and in fact, all you have into one single point of execution. Truly, you must agree that one

shoulder work, do it in the off season along with general conditioning and strengthening. But in season save your power for what will help you most.

The see and rep scheme is as follows: Warm-up as needed but don't fatigue yourself. The idea is to get prepared and not to get tired. Establish a warm up pattern. This pattern should be repeated every workout as well as in competition if you want to compete. The idea is to go from **400** to **500** and from **500** to **600**. It was also the mainstay from **600** to my attack on **700**. It has never failed to help others. If you try the program try it without alteration. Use it just as outlined. If you feel you need to modify it of course you can to suit your needs, but the program is so basic that it will only tolerate slight modification without becoming a totally foreign entity. Keep in mind that it may be you that needs the modification, not the program. Build your focus, intensity, and confidence in your power. Try it without alteration. Then if you feel it necessary, modify it to your taste but try to keep its context in fact. I realize there is more than one way to skin a cat. Good luck.

Farther from the meet, say more than six to eight weeks. I suggest four sets of six reps with a one second pause. Closer to the meet, switch to triples with just a bit longer pause (1.5 seconds).

For the tricep exercise, only a brief warm up is needed (2 sets) and right to the work. Follow the same pattern (**4x6** or **4x3**) but without the pause. Closer to the meet, DO NOT take lots of true maxes. Also one other note concerning the warm up that is especially true at meets: Use poundages that require only **45*** & **25***. Don't waste time and energy tailoring up odd bar loads and hunting for small denominated plates. You have enough to say that the bar should bounce or switch to triples with just a bit longer pause (1.5 seconds).

STAY AWAY from the bench. Use this period to develop weak areas. Do general body building movements and hit the rotator cuff muscles. Give the bench a break.

One final point: use your shirt on your near max attempts beginning no later than 6 weeks out. You must practice singles in your shirt well prior to meet day. I would say it again because so many make this mistake but that would be doubly redundant. To prepare properly this can not be overlooked.

This is the exact program I used to go from **400** to **500** and from **500** to **600**. It was also the mainstay from **600** to my attack on **700**. It has never failed to help others. For An Explosively Powerful Work-Out That Builds Lower Body Strength You Need...

- Great for power lifting, football, track & field and cycling
- Improves cardiovascular endurance
- No impact on lower back
- Solid steel construction
- Non-destructive to grass
- Quick recovery time
